Kalwall Corporation has announced a new FM-approved Explosion Venting Wall Panel System. The system’s function is to provide an easy escape route into the atmosphere for explosive forces caused by an accident within a laboratory or manufacturing area. A building can withstand an explosion without collapsing roofs and floors, or other effects to structural integrity, if the forces of the explosion can be released.

Kalwall’s Explosion Venting Walls, a.k.a. “blow-out” or “pressure relieving,” are designed to release from their mounting system should an explosion occur inside a building. After release, the panels remain attached to the side of the building and do not become dangerous falling debris. In many cases, the panels can then later be reinstalled.

Kalwall’s Explosion Venting Panels are fully pressure release tested under Factory Mutual Research Corporation Standard 4440 for Damage-Limiting Construction. The Kalwall panels are not merely a component, but are fully approved as an integrated system.

BACKGROUND

A major consideration for utilizing Kalwall’s Explosion Venting Panels is the other inherent properties of Kalwall. The product has long been renowned for its excellent light transmitting, light diffusing, highly insulating and lightweight properties. Kalwall is shatterproof, flame resistant… and provides a “clean-room” environment.

Kalwall panels, 2 ¾” (70mm) thick, are factory-constructed fiberglass laminate permanently bonded to interlocking thermally broken I-beam grids. Panels are available up to 5’ (1.5m) wide by 20’ (6m) long. Kalwall was the originator of translucent building panels and, for over 50 years, has continued to produce innovative building materials and products.

Standard Kalwall helps protect building occupants by eliminating line-of-sight vulnerability from outside a building. Shatterproof - free of flying debris.
Each explosion venting project is unique. The following details are generic. Please contact Kalwall directly for assistance in designing to meet FM requirements.

STANDARD SYSTEM
ALUM | PANELS

NOTE:
IF KALWALL EV SYSTEM IS TO BE SET BACK FROM OUTSIDE FACE OF ROUGH OPENING, A MINIMUM 3/4" STANDOFF IS REQUIRED.

NOTE:
MINIMUM EV RELEASE PRESSURE MUST BE DESIGN WIND LOAD PLUS 10±3 PSF (480Pa)

NOTE:
MINIMUM PANEL AREA 24 Sq Ft (2.2 Sq Meters)

THERMALLY BROKEN SYSTEM
TB-1 PANELS

EXPLOSION VENTING SYSTEM FOR 2 3/4" (70mm) PANELS

AVAILABLE AS AN OPTION
